

inline

vortex flowmeter

Model Vortex PhD™ General Specification

Features

- ▶ Reliable—no moving parts, no fluid to sensor contact
- ▶ In-process removable sensor, below 750 psig (52 barg) pressure
- ▶ Simple, rugged, all welded construction, no internal gaskets, no leak paths
- ▶ High accuracy with wide rangeability
- ▶ Line sizes from 1" to 12" (25–300mm)
- ▶ High temperature operation up to 750°F (400°C)
- ▶ EZ Logic™ menu-driven user interface
- ▶ ‘Smart’ electronics provide excellent noise immunity
- ▶ Compatible with HART Protocol
- ▶ Optional Dual sensors and transmitters for fail-safe monitoring

The EMCO Vortex PhD vortex shedding flowmeter measures process fluid flow by detecting the frequency at which vortices are shed from an obstruction in the process fluid line (the bluff body). A piezo-electric sensor mounted outside the flow line acts as the transducer, converting vortex pulses into electrical signals.

The ‘Smart’ electronics provide excellent noise immunity while the wide range of wetted materials provide outstanding compatibility with most process fluids. The transmitter provides a frequency output, scaled frequency output, totalizer pulse or a 4-20 mA DC signal proportional to the flow rate.

Performance Specifications

Accuracy

Liquid $\pm 0.7\%$ of flow rate
Gas and Steam $\pm 1.0\%$ of flow rate
Analog Output Version ... Add $\pm 0.1\%$ of full scale

Repeatability

$\pm 0.15\%$ of flow rate

Operating Specifications

Fluid Types

Liquid, gas or steam

Line Sizes

1"-12" (25mm to 300mm)

Process Temperature Limit

-40 to 750°F (-40 to 400°C)

Process Pressure

Flange

ANSI Class 150, 300 or 600, PN16, 40, 64

Wafer

All wafer bodies are rated based on appropriate flange rating to a maximum of ANSI Class 600

Enclosure Specifications

Approved for NEMA 4X watertight and dust tight requirements.

Ambient Temperature Limit

Normal

-20 to 140°F (-29 to 60°C)

Display Option

32-140°F (0-60°C)

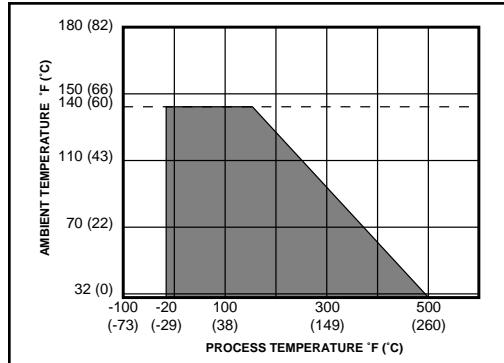

Figure 1. Ambient Temperature Range for Locally Mounted Electronics.

Ambient Humidity Limit

5-100% RH non-condensing

Power Requirements

18-40 VDC; max power consumed: 1 watt

Response Time

Adjustable from 1-100 seconds (analog version output)

K-factor-Temperature Correction

The K-factor of the flowmeter decreases by 0.29% for each 100°F (39°C) increase in temperature above 70°F (21°C). The converse is true below 70°F (21°C). By programming the operating fluid temperature in the electronics, the change in the K-Factor is automatically corrected for.

Output

Analog

4-20 mA, loop powered 2 wire system, digitally adjusted span

Frequency

Voltage pulses, 3 wire system, 1 to 10 kHz square wave, open collector FET output with selectable pull-up resistors. The pulse output can be scaled so that 1 pulse represents a specific quantity of fluid passing through the flowmeter. For typical applications, the amplitude of the squarewave can be determined by:

$$V_{pulse} = V_s - (I \cdot R_{load})$$

For other options refer to the Vortex PhD manual

Span Setting

For analog outputs the span setting can be adjusted without the use of electronic test equipment by programming the full scale rate using the EZ Logic™ keypad.

HART Protocol

In addition to using the keypad for field configuration, the Vortex PhD is also compatible with a laptop PC using a Hart Modem and EMCO EZ Comm communications software. This can be used to calibrate the 4-20 ma settings, set the 20 mA point, assign a tag or descriptor, display flowrate, output level, total, velocity and shedding frequency.

Cable Conduit Connection

ANSI 3/4" female NPT. See Dimensions. (p. 9)
DIN PG 13.5. See Dimensions. (p. 9)

Signal Cable

18, 20 or 22 gauge, shielded instrumentation cable. Belden #9939 double shielded cable or equivalent required for European CE rating.

Measurable Flow Velocities

Liquid

1.5 to 32 ft/sec (0.5 to 9m/sec)

$$\text{Gas/Steam } \sqrt{\frac{50}{\rho}} \text{ to } 260 \text{ ft/sec } \left(\sqrt{\frac{74}{\rho}} \text{ to } 79 \text{ m/sec} \right)$$

Where:

$$\rho = \text{density in } \frac{\text{lb}}{\text{ft}^3} \left(\frac{\text{kg}}{\text{m}^3} \right)$$

Process Viscosity

Reynolds number must be > 20,000 (See Figure 3)

Linear Range

Reynolds Numbers of 20,000 to 7,000,000

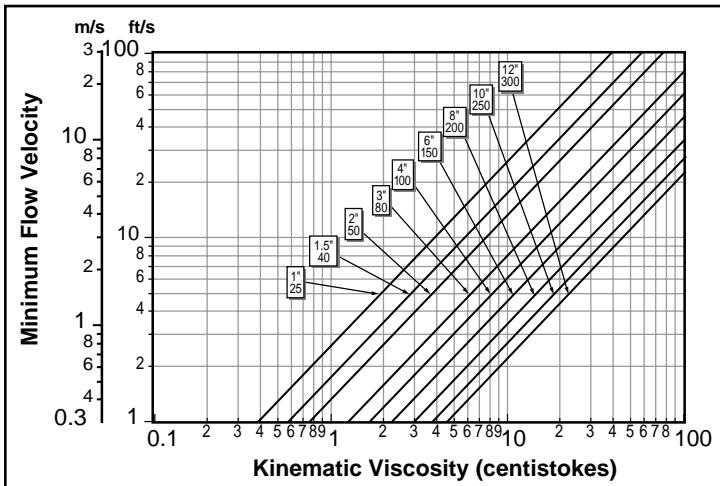

Figure 3. Minimum Linear Flow Velocity vs. Kinematic Viscosity.

NOMINAL SIZE		NOMINAL PULSE RATE		NOMINAL METER FACTOR			
inch	mm	Hz/ft/s	Hz/m/s	pulses/gal	pulses/L	pulses/ft³	pulses/m³
1	25	12.0	39.4	321.2	84.9	2,403	84,864

8	200	1.3	4.3	0.6	0.2	4.2	148
10	250	1.2	3.9	0.3	0.1	2.2	78
12	300	1.0	3.3	0.2	0.1	1.3	46

Table 1. Nominal Pulse Rate and Flowmeter Factor.

NOMINAL SIZE		FLOW RANGE in GPM		FLOW RANGE in L/s	
inch	mm	min	max	min	max
1	25	3.4	72	0.2	4.5
1.5	40	8.3	176	0.5	11.1
2	50	13.8	295	0.9	18.6
3	80	30.9	659	1.9	41.6
4	100	53.8	1,147	3.4	72.3
6	150	121.9	2,600	7.7	163.9
8	200	213.5	4,555	13.5	287.2
10	250	358.7	7,653	22.6	482.5
12	300	508.3	10,843	32.0	683.7

Table 2. Water Flow Rates.

Notes:

- Water values are determined at standard conditions of 60°F (15°C).
- The minimum flow rate for the 1" (25 mm), and 1.5" (40 mm) flowmeters are below the linear range—the Reynolds number < 20,000.
- The velocities used to calculate the minimum and maximum flow rates were 1.5 ft/sec and 32 ft/sec (0.5 m/sec and 9 m/sec) respectively.

For EMCO Flowmeter Sizing Download emcosizing program
"emcosize" at www.emcoflow.com

Flowmeter Sizing

Selecting the appropriate size flowmeter can be critical. If the flowmeter is over-sized, the signal strength could be weak—limiting rangeability. If the flowmeter is undersized, excessive pressure drop or cavitation may occur—affecting accuracy. Use the minimum linear flow velocity curves and Tables 2 through 8 (minimum and maximum flow rates for various types of applications) for general sizing. For more detailed information, contact your EMCO representative or go to www.emcoflow.com for EMCO computerized sizing program.

Pressure Loss

If a differential pressure transducer were connected between pressure taps upstream and downstream of a vortex flowmeter, the measured differential pressure would be the pressure loss for the device. This value can be calculated using the following equations:

$$\begin{aligned} \text{English} \dots & \Delta P = 2.67 \times 10^{-4} \cdot p \cdot V^2 \\ \text{or} \dots & \Delta P = 2.50 \times 10^{-3} \cdot p \cdot (Q_1)^2 / D^4 \\ \text{or} \dots & \Delta P = 4.47 \times 10^{-5} \cdot p \cdot (Q_2)^2 / D^4 \\ \text{Metric} \dots & \Delta P = 1.24 \times 10^{-5} \cdot p \cdot V^2 \\ \text{or} \dots & \Delta P = 5572 \cdot p \cdot (Q_1)^2 / D^4 \\ \text{or} \dots & \Delta P = 20.1 \cdot p \cdot (Q_2)^2 / D^4 \end{aligned}$$

Where:

$$\begin{aligned} \Delta P &= \text{Pressure loss psi (bar)} \\ p &= \text{Density at operating conditions lb/ft}^3 (\text{kg/m}^3) \\ V &= \text{Flow velocity in ft/s (m/s)} \\ Q_1 &= \text{Volumetric flow rate in ACFM (Actual m}^3/\text{min)} \\ Q_2 &= \text{Volumetric flow rate in U.S. GPM (L/s)} \\ D &= \text{Flowmeter internal diameter in inches (mm)} \end{aligned}$$

Minimum Back Pressure (Liquid Service Only)

The line pressure must be sufficiently high so that no cavitation occurs. The minimum required line pressure can be obtained from the equation:

$$P_G \geq (1 \cdot 3 \cdot P_o) + (2.7 \cdot \Delta P) - P_{ATM}$$

Where:

$$\begin{aligned} P_G &= \text{Line pressure required psig (barg)} \\ \Delta P &= \text{Maximum pressure loss psig (barg)} \\ P_o &= \text{Saturation liquid vapor pressure at operating temperature psia (bara)} \end{aligned}$$

$$P_{ATM} = \text{Atmospheric pressure psia (bara)}$$

Example:

Water flow rate: 0 to 200 US GPM

Operating temperature: 100 °F

Operating pressure: 10 psig

Atmospheric pressure: 14.7 psia

Flowmeter size: 1.939" I.D.

Specific weight: 61.96 lb/ft³

Solution:

$$\begin{aligned} \Delta P &= 4.47 \times 10^{-5} \cdot 61.96 \cdot (200)^2 / (1.939)^4 = 7.84 \\ P_G &= [(1.3) \cdot (0.951)] + [(2.7) \cdot (7.84)] - 14.7 \\ P_G &= 7.70 \text{ psig} \end{aligned}$$

Since the operating pressure of 10 psig is higher than 7.70 psig, no cavitation occurs.

Physical Specifications

Materials

Wetted Parts

Wing and Shudder Bar

- Stainless steel and Carbon steel Models 316L or the cast equivalent, CF3M

- Hastelloy Model
Hastelloy Alloy C-22

Body

All Other Parts

Stainless Steel

Flowmeter Classification

Standard

Designed to meet NEMA 4X watertight and dust tight specifications

Explosion Proof version

FM and CSA approved

Explosion Proof and Intrinsically-Safe version

CENELEC approved

European CE Mark

Approved

Remote Mount Electronics (RMT)

Signal cable is provided to mount the electronics enclosure up to 30 ft (optional 50 ft) from the flowmeter body, and must be installed within proper electrical conduit.

Local Indicator and Totalizer (LOC-TOT)

The indicator displays flowrate and total in user-selectable, engineering units. It is a two line, 8 character per line, LCD display. The totalizer enables a pulse output providing a 5–999 msec pulse each time the totalizer increments.

Note: This option changes the lower, ambient temperature limit to 32°F (0°C). Below 32°F, the display intensity begins to fade but does not affect the transmitter output.

Material of Construction

All models are available in stainless steel; some models can be ordered in Hastelloy C-22 or carbon steel.

FM Approval (Explosion Proof)

Class I, Div. I, Groups B, C, D

Class II, Div. I, Groups E, F, G

Class I, Div. II, Groups A, B, C, D

Class II, III, Div. 2, Groups F, G

CSA Approval (Explosion Proof)

Class I, Div. I, Groups B, C, D

Dust-ignition Proof for Class II, Div. 1 Groups E, F, G

Class III Hazardous locations

CENELEC Approval

(Explosion Proof and Intrinsically Safe)

EEX d [ib] IIC T6 and/or EEX d IIC T6.

Accessories

Flow Rectifier (EFR)

When there is not sufficient straight run of pipe available or flow disturbance exists, use of a flow rectifier is recommended. When using an EFR, the straight pipe run can be a combination of 5 pipe diameters upstream and 2 pipe diameters downstream, instead of the standard 10 and 5.

Flow Processor

A microprocessor-based flow processor can be used to significantly increase the accuracy and functionality of any flowmetering application. See the FP-93 or FP-100 General Specifications for complete details.

Straight Run Piping Requirements

Typical 10 diameters upstream, 5 diameters downstream. In certain applications where multiple bends or butterfly valves are present, more straight run may be required.

	Upstream	Downstream
One 90° elbow before the meter	10 D	5 D
Two 90° elbows before the meter	15 D	5 D
Two 90° elbows out of plane before the meter	30 D	5 D
Reduction before the meter	10 D	5 D
Regulator or valve partially closed before the meter	30 D	5 D

Other Installation Considerations

Installation

Flowmeter can be installed vertically, horizontally, or at any angle. For liquid service, the flow line must be full during flowmeter operation—flow up in vertical lines is recommended.

Site Selection

The flow measurement location should be selected to minimize turbulence and swirl. The extent of these flow disturbances depends upon the piping configuration. Valves, elbows, pumps and other piping components may add disturbances to the flow.

Servicability

The sensor element can be removed, and replaced, without removing the flowmeter body from the process line, and without process shut down—for process pressures below 750 psig (52 bar). The flowmeter K-factor is not affected by sensor or electronics servicing. The Dual option allows service of one sensor and electronics while the other transmitter provides continuous flow measurement.

Pressure and Temperature Taps

Pressure tap should be mounted 3.5 to 7 pipe diameters downstream from the flowmeter. The temperature tap should be mounted an additional 3.5 to 7 pipe diameters downstream of the pressure tap. See Figure 2.

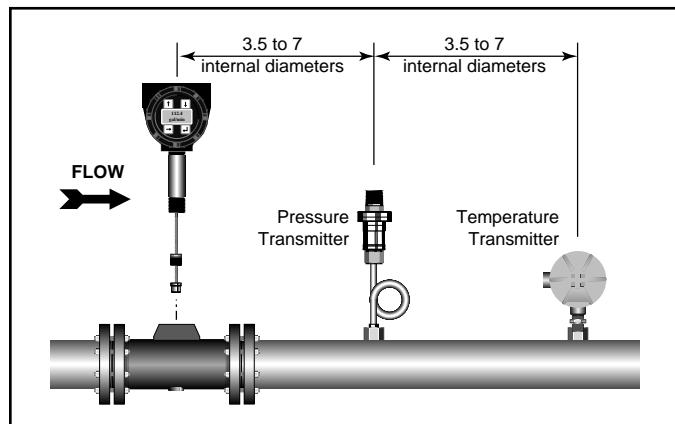

Figure 2. Pressure and Temperature Tap Dimensions.

Table 4. Saturated Steam Flow Rates at Selected Process Pressures (Metric)^{1,2}
(Minimum and Maximum Operating Flow Rates in kg/hr)

For EMCO Flowmeter Sizing Download emcosizing
program "emcosize" at www.emcoflow.com

Notes:

1 Maximum flow velocity is 260 ft/sec (79 m/s) or Reynolds number limit or 7,000,000 whichever is less.

2 Minimum flow velocity is $\sqrt{\frac{50}{\rho}}$ ft/sec, where ρ =density in $\frac{\text{lb}}{\text{ft}^3}$ ($\sqrt{\frac{74}{\rho}}$ m/sec, where ρ =density in $\frac{\text{kg}}{\text{m}^3}$) or Reynolds number limit of 20,000 whichever is greater.

Notes:

1 At standard conditions of 60°F and 14.7 psia, SCFH: standard cubic feet per hour (0°C and 1.013 bar, NCMH: Normal cubic meters per hour).

Process temperature is 60°F (16°C).

2 Maximum flow velocity is 260 ft/sec (79 m/s) or Reynolds number limit or 7,000,000 whichever is less.

3 Minimum flow velocity is $\sqrt{\frac{50}{\rho}}$ ft/sec, where ρ =density in $\frac{\text{lb}}{\text{ft}^3}$ ($\sqrt{\frac{74}{\rho}}$ m/sec, where ρ =density in $\frac{\text{kg}}{\text{m}^3}$) or Reynolds number limit of 20,000 whichever is greater.

Table 8. Natural Gas Flow Rates at Selected Process Pressures (Metric).^{1,2,3,4}

For EMCO Flowmeter Sizing Download emcosizing
program "emcosize" at www.emcoflow.com

Notes:

- At standard conditions of 60°F and 14.7 psia, SCFH: standard cubic feet per hour (0°C and 1.013 bar, NCMH: Normal cubic meters per hour).
- Process temperature is 60°F (16°C).
- Maximum flow velocity is 260 ft/sec (79 m/s) or Reynolds number limit or 7,000,000 whichever is less.
- Specific Gravity of natural gas = 0.61 and 0.8% N₂.
- Minimum flow velocity is $\sqrt{\frac{50}{\rho}}$ ft/sec, where ρ =density in $\frac{\text{lb}}{\text{ft}^3}$ ($\sqrt{\frac{74}{\rho}}$ m/sec, where ρ =density in $\frac{\text{kg}}{\text{m}^3}$) or Reynolds number limit of 20,000 whichever is greater.

Dimensions and Weights

**Figure 4. Dimensions and Weights:
Wafer Connection Type, Integral Mounting.**

Wafer Connection

Wafer connection is available in stainless steel (sizes 1–4" only) and Hastelloy (sizes 1–3" only). The schedule of the mating pipe's internal diameter \geq dimension "D".

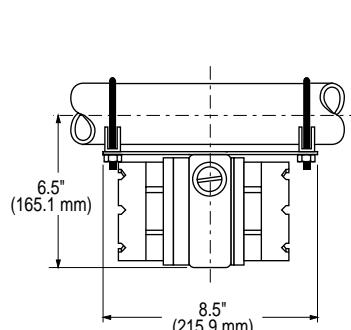

SIZE (in)	A (in)	B (in)	C (in)	D (in)	APPROX WT (lb)

Table 14. Metric Weights & Dimensions: Dual.

Wiring

Figures 8–10 represent typical field wiring applications for the Vortex PhD.

Analog Output

The Vortex PhD may be operated using a 24 VDC power supply. The 4-20 mA output is scalable (2 wire principle.) The load resistor may be installed on supply or return line. Permissible load resistance values are shown in Figure 8.

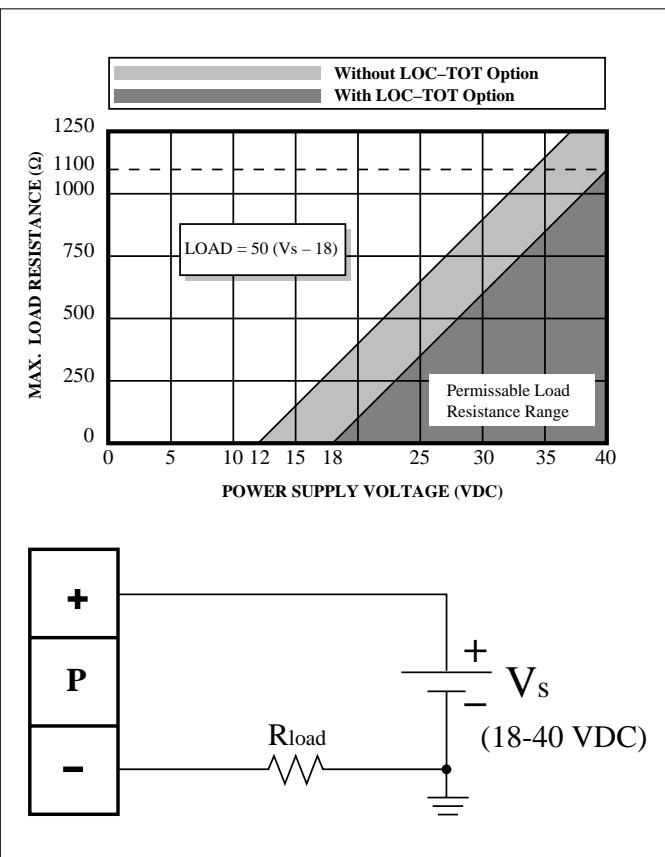

Figure 8. 4-20 mA Output.

Pulse Output

This is an open collector pulse output using a high impedance electronic counter. V_{pulse} will vary from:

$$0 - 1 \text{ V to } V_{pulse} = V_s \left(\frac{R_C}{R_C + R_{pulse}} \right)$$

Note: $R_{pulse} \geq \left(\frac{V_s}{0.16} \right)$

Where:

V_{pulse} = pulse output amplitude

R_C = counter impedance

V_s = power supply voltage

V_c = minimum required voltage to trip counter

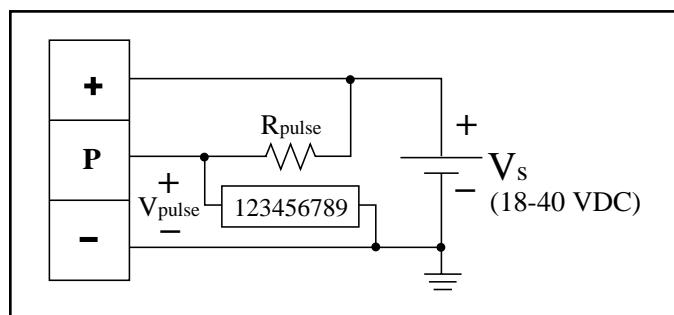

Figure 9. Pulse Output.

Wiring

Cenelec Approved—Power & Signal Wiring

The Vortex PhD flowmeter may be operated using a 24 VDC power supply. The wiring schematic shown is for the areas defined by the Cenelec approval (see approval description in options section). I. S. zener barriers must have the following specifications:

V_{max}	= 29 VDC	= Maximum voltage which may be connected to barrier terminals
J_{max}	= 110 mA	= Maximum current which may be connected to barrier terminals
C_{int}	= 1.5 nF	= Maximum equivalent internal capacitance across barrier terminals
L_{int}	= 0 H	= Maximum equivalent internal inductance across barrier terminals

The 4-20 mA output is scalable (2 wire principle.) The 4-20 mA loop resistor should be 250 Ω; and the pulse output is to be connected to a high impedance, electronic counter.

$$V_{pulse} \text{ varies from: } 0 \text{ - } 1 \text{ VDC to } V_{pulse} = V_s \left(\frac{R_c}{R_c + R_{pulse}} \right)$$

Note: $R_{pulse} \geq \frac{V_s}{0.16}$

Where:

- V_{pulse} = Pulse output amplitude
- V_s = Power supply voltage (18 to 29 VDC)
- R_{load} = Load resistance
- R_c = Counter impedance
- R_{pulse} = Pull-up resistance

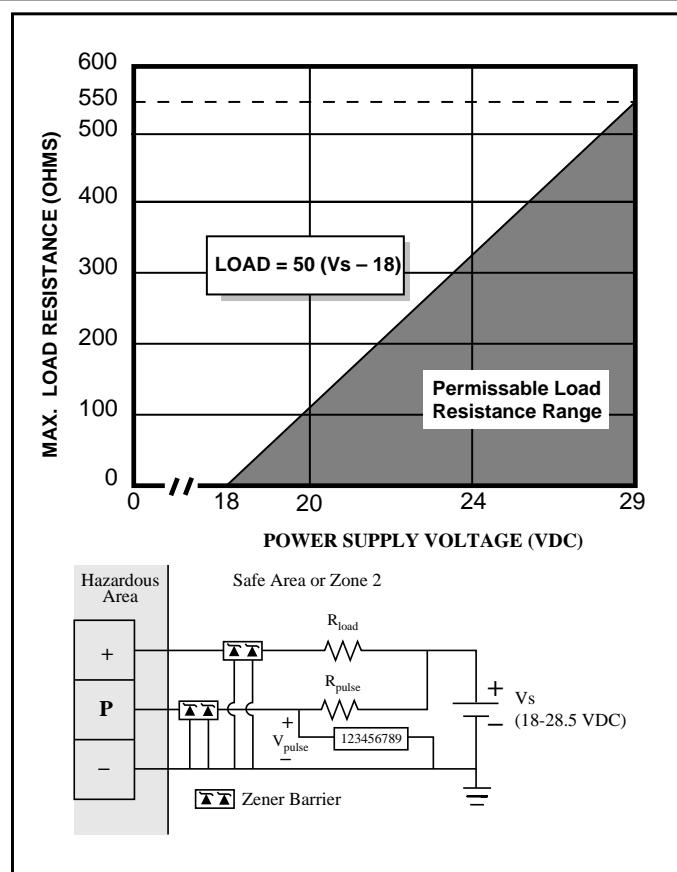

Figure 10. CENELEC Approved (Intrinsically Safe).

110/220 VAC—Power & Signal Wiring

The Vortex PhD flowmeter may be operated using a 110/220 VAC power supply. The power supply board converts the 110/220 VAC to 24 VDC. The 4-20 mA output is scalable (2 wire principle.) The 4 - 20 mA loop resistor should be 250 Ω; and the pulse output is to be connected to a high impedance, electronic counter. (Figure 11)

$$V_{pulse} \text{ varies from } 0\text{--}1 \text{ VDC to } V_{pulse} = 24 \text{ VDC} - (I \cdot R_{load})$$

Where:

- V_{pulse} = Pulse output amplitude
- R_{load} = Load resistance (250 Ω)
- I = Current (4 - 20 mA)

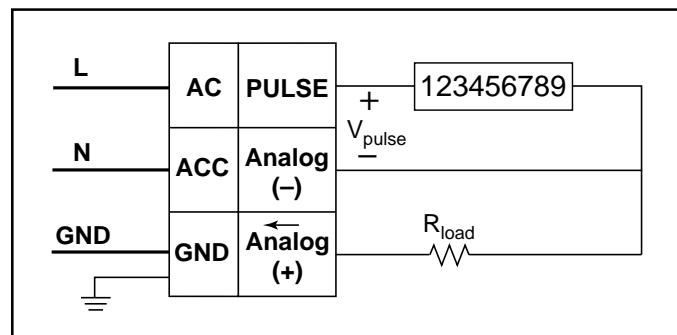

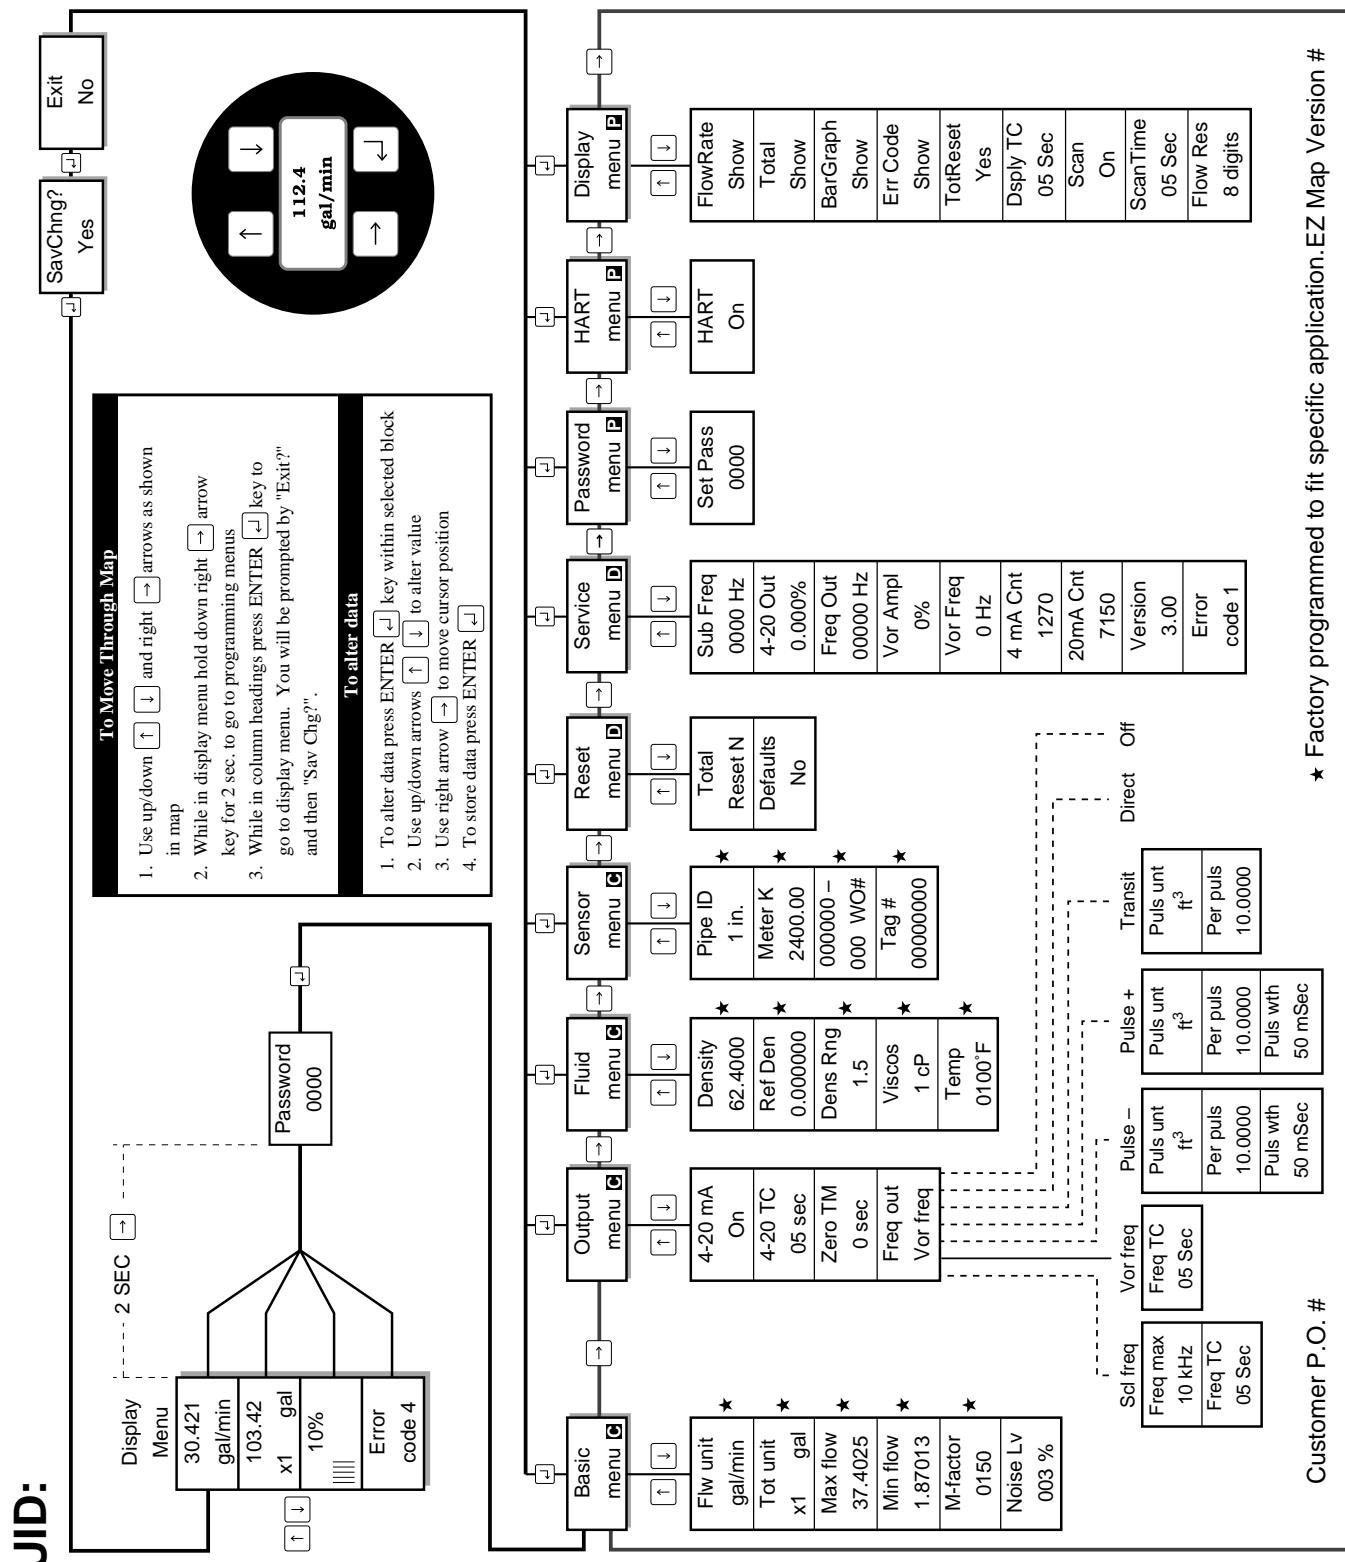

Figure 11. Frequency/4-20 mA Output Using 110/220 VAC Power.

Table 15. PhD Vortex Shredding Flowmeter.

Notes:

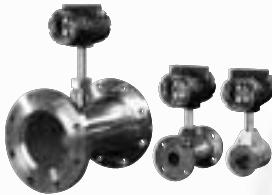

- 1 Has 4-20 mA and/or 50% duty cycle frequency output. A 50% duty cycle frequency can be scaled.
- 2 FM and CENELEC approved meters come with a magnet wand. For all other meters the wand can be ordered as an option.
- 3 At least one local indicator is recommended at each site. If one display will be used on many meters, should be purchased separately.
- 4 Remote mount electronics are required for high process temperatures (refer to the general specification). The standard remote mount option comes with 30' of cable.
- 5 Not available with European CE Mark or FM, CSA and CENELEC approvals.
- 6 Wafer style meters available in stainless steel (sizes 1–4" only) and Hastelloy (sizes 1–3" only). (Not available with dual option).
- 7 Dual flowmeter is *not* available with wafer connections or CSA approval.

Providing innovative flowmeter products and services for over three decades . . .

Engineering Measurements Company (EMCO) is a long established manufacturer of precision flowmeters for liquid, gas, and steam applications for commerce and industry. Manufactured under an ISO 9001 certified quality system, which includes extensive flow calibration capability, engineering, applications, and service, underpinning a world-wide sales and service organization totally focused on providing the best flowmeters and customer service in the industry.

- ▶ Manufacturing is housed in a modern plant located in Longmont, Colorado
- ▶ Modern clean-room, mechanized assembly equipment, and computer based testing ensure the highest quality product
- ▶ Trained professional flow specialists and technicians offer timely customer assistance
- ▶ Factory trained and certified field technicians provide product support services
