

Plenty

G2000

G2000 - SLIDING VANE PUMP

Plenty Mirrlees

LUBRICANTS BLENDING

G2000

G2000 Lubricants Transfer Pump connected to piping with compressed air purge and pigging system.

- BASE OIL TRANSFER
- SHEAR SENSITIVE ADDITIVES
- TANK RECIRCULATION BLENDING
- BLENDED OIL TRANSFER
- GREASE
- TRUCK LOADING *
- BARGE LOADING *
- DRUM FILLING *
- BOTTLE/CAN FILLING MACHINES *

*see also U2000 variable flow pump range with CPC.

Liquid products ranging in viscosities from 1CST to 75,000 CST are handled with a G2000 vane pump, with mechanical seals used for most applications.

■ Standard pumps - heavy duty industrial

The G2000 standard pumps are built of cast iron or steel case construction according to clients preference, and can be fitted with integral relief valve, and heating jackets as necessary for the duty.

■ API 676, and other specifications

The G2000 Pumps can be supplied in accordance with the requirements of API 676. Other international pump standards, or client specific requirements can be accommodated.

■ Unitisation

Pumps can be supplied as bareshaft or fully assembled with driver on a baseplate (API or Industrial design), with spacer or non-spacer coupling, and non-spark guard.

BITUMEN & ASPHALT

G2000 Pump with integral Heating Jackets and high temperature paint finish.

- TANK TO TANK TRANSFER
- IN-LINE BLENDING
- TRUCK LOADING*
- BARGE LOADING*
- DRUM FILLING*
- BITUMEN EMULSION
- ORIMULSION
- STANDARD CONSTRUCTION UP TO 300°C (570 °F)

*see also U2000 variable flow pump range with CPC.

The Plenty rotary vane pump is able to perform continuous pumping during temperature changes where centrifugal pumps normally fail. For applications up to 200°C it is normal to use an internal bearing pump with only 1 mechanical seal. (2 seals on higher temp external bearing pumps).

G2000 HEAVY DUTY SLIDING VANE PUMP

Standard pump assembly options include:

- INTERNAL OR EXTERNAL ROLLER BEARINGS.
- INTERNAL SLEEVE BEARINGS
- MECHANICAL SEAL OR GLAND PACKING
- SEAL FLUSH AND/OR QUENCH IF REQUIRED
- SINGLE OR DOUBLE MECHANICAL SEALS. CARTRIDGE SEALS IF SPECIFIED
- CAST AND FABRICATED BASEPLATES, WITH DRIP RIM AND DRAIN FACILITY IF REQUIRED
- INTERNAL PRESSURE RELIEF VALVE (EXCLUDED/BLANKED OFF, FOR API 676 SERVICE)
- JACKETED CASINGS FOR HIGH TEMPERATURE DUTIES
- HARDENED ROTATING ASSEMBLY (NITRIDING) FOR ARDUOUS SERVICES

THE ROTATING ASSEMBLY

The unique rotating assembly consists of eight working blades made up as two sections set 45° apart, each section consisting of two half blades and one "H" blade.

The photograph shows only one rotor and the roller bearings used on an inboard pump.

Pump Features

Plenty vane technology

Versatile design concept

Robust construction

Double Suction

Slow running

Low noise

High volumetric efficiency

Self draining

Viscous Pumping

Mechanical Seals

Heating Jackets

2000 Series parts Interchangeability

Relief valve

API 676

& User Benefits

The Plenty pumping principle has less wear and lower maintenance than conventional vane pump design technology.

Standard pump arrangements suitable for viscosity applications from 1 cst to 75,000 cst (for higher viscosities, contact Plenty Ltd)

Heavy duty bearing arrangement designed for long operational periods between routine maintenance.

Low NPSH required characteristics

In addition to long service life, the slow pumping action has a very low shear rate, dramatically reducing or even eliminating emulsification of the pumped liquid.

Environmentally acceptable for site operators

Low running costs.

Zero retention, avoids cross contamination when installed for multi product service.

Unlike some other vane pumps, the Plenty vane and blade assembly enables the pump to operate at high viscosities whilst maintaining high efficiency.

The seal housing is in accordance with the standard dimensions of DIN 24960, and can therefore accommodate most brands of mechanical seals.

The pump can be fitted with jacketed covers to allow heating by hot oil or steam. (electric heat tracing can be used on non jacketed pumps)

G2000 pumps use identical rotors and blades from the U2000 pump range, offering maximum parts interchangeability.

All G2000 pumps can be fitted with an internal pressure relief valve to protect the pump from excess pressures.

Refinery specifications and client special requirements can be accommodated.

THE PUMPING PRINCIPLE

The eccentricity between the shaft and rotor causes the chambers formed between the rotor and blades to vary in size as the pump rotates. The liquid entering the pump is guided into the ends of the rotor and then back out through the discharge port.

There are eight pumping sectors and the illustration shows how the sector increases and decreases in size during rotation. Each sector in turn acts in the same manner, causing the continuous pumping action.

Unlike a conventional vane pump the blade tip is not rotating at high peripheral speeds against a liner (which could cause rapid wear to the blade tip). The G2000 blades are gently sliding along a flat inside the rotor, thus reducing wear and maintaining high volumetric efficiency.

This pumping principle has a low shear rate which is important for blending lube oils or pumping shear sensitive fluids such as oily water mixtures to a separator for example.

*NOTE. The smallest pump model G2000-10 (2") incorporates single suction 4 blade design due to small flow rates and corresponding compact construction.

VISCOUS FLUIDS

G2000 Pump with Heat Tracing prior to lagging.

- POLYMERS
- RESINS
- ADHESIVES
- HEAVY FURNACE OILS
- MOLASSES*
- EDIBLE OILS
- VARNISH
- INKS
- DISTILLATE FUELS

*For massecuite duty, see Magmo Pump Range

G2000

Viscous fluids up to 75,000 CST are handled with a standard pump, and viscosities up to 500,000 CST with a factory modified pump and seal.

■ Non standard pumps

The G2000 pump design can be factory modified for extremely viscous, or arduous refinery, applications. Materials of construction are selected according to the fluid nature.

■ Specialist Sealing

Special sealing options are available including single, double and tandem arrangements, in component or cartridge configuration.

■ Sealless Magnetic Drive

When single or double mechanical seals are not able to provide a safe seal arrangement then a U2000 pump with magnetic drive should be selected.

CHEMICAL

G2000 Pump in Bronze/Stainless Steel construction.

- FATTY ACIDS
- VISCOUS CHEMICAL ADDITIVES
- ACETATE DOPE
- VISCOSE
- POLYMERS
- RESINS
- SOAPS / SOAP STOCKS
- POLYOLS

Materials of construction range from basic Cast Iron / Steel, to NI-Resist, Bronze and Stainless Steel Alloys, to ensure compatibility with the fluid to be pumped.

FLOW RANGE

(Pump frame size is nominal design flow in M³/Hr. e.g. G2000-40 is nominally a 40M³/Hr Pump).

APPROXIMATE DIMENSIONS

| PUMP SIZE | 10 | 20 | 40 | 100 | 250 | 350 | 500 | Standard flanges are to ANSI dimensions IRON – ANSI 125FF and 250FF. STEEL – ANSI 150RF and 300RF. |
|-----------|----|----|----|-----|-----|-----|-----|--|
| SUCTION | 2" | 3" | 4" | 6" | 10" | 12" | 14" | |
| DISCHARGE | 2" | 3" | 4" | 6" | 8" | 10" | 12" | |

*Pumps can be constructed with suction left (as shown) or suction right, to suit installation.

Approximate dimensions (mm). DO NOT use for installation purposes.

| PUMP SIZE | PUMP ONLY | | | | | UNIT | | | | *ELECTRIC MOTOR | | | | |
|-----------|-----------|-----|-----|-----|-----|------|-----|------|-----|-----------------|------|------|------|-----|
